Josh Park

Phoenix, AZ | gosupark27@gmail.com | github.com/gosupark27

I ship code with soul.

Engineer who makes AI agents reliable for others: specs, invariant tests, approval gates, cross-model evaluation.

Technical Skills

Languages & Frameworks: JavaScript, React, Python; SQL (PostgreSQL) for data modeling
AI-Native Engineering: prompt design (one-shot accuracy as the bar), multi-model one-shot loop, cross-model evaluation, human-gated agent orchestration, agent-readable specs and invariant tests
Models & Agents: Claude Opus 5.5 (Claude Code), GPT-6 Astra, Gemini 4 Argon, Grok 4.7 (Grok Build); Hessa (a background agent I configured to monitor my GitHub repos and versioning)
Learning: Rust, Go (in progress)

Experience

Lee's Shoe & Luggage Repair July 2024 – Present
Web Application Development (family business, serving the West Valley since 1994) *Peoria, AZ*

- Turned a paper-and-pen shop's intake and service workflow into requirements for a site and ticketing app [**TODO: tickets/mo**]
- Shipped the public site in vanilla **JavaScript** on Cloudflare (no libraries, to test prompt quality): services drawn from past ticket data, filterable gallery, quote email [**TODO: URL / quotes**]
- Designed the ticket app's **PostgreSQL** data model (customers, tickets, items, repairs, payments; indexed foreign keys, updated-at triggers, calculated balances) behind **React** intake forms and a **Python**/Flask API: one source of truth for workflow, scheduling, revenue, and KPIs
- Direct Claude Code inside explicit task boundaries; I review and approve every change before commit or push

FAST Enterprises Mar 2024 – June 2024
Solutions Engineer *Atlanta, GA*

- Monitored overnight state-tax batch runs; investigated and resolved failed data transactions with **SQL** [**TODO: volume**]
- Maintained taxpayer web forms and the validation rules applied before data reached Microsoft SQL Server
- Gathered requirements and secured cross-functional stakeholder approval before implementing software changes

Projects: Living Mirror OS (LMOS)

Handshake, LMOS public multiplayer game | *React, TypeScript, PostgreSQL* | source Oct 2026 – Present

- Phone-first social-deduction game (room codes, no login) built from my spec for a Handshake AI challenge
- Multi-model loop: Grok drafts the prompt and predicts the result; Claude builds; I diff the two. GPT, Gemini, and Claude rerun the revision, Grok merges, and any unanimous answer is inverted as a blind-spot check (3-round cap)
- Server-authoritative design: clients send intents, never state; secrets (saboteur, "secret elo" truthfulness score) never reach the phone; append-only ledger; idempotent actions; server-owned clock, enforced by 9 invariant tests
- Impact goal: 5–10 real games fully played [**TODO: games played / unique players**]. *Planned:* TDD and training-data agents, RAG-assisted CI/CD, and community voting weighted by secret elo

LMOS Platform | *in design* In progress

- A foundation for other builders to create games inside my guardrails (locked invariants, approval gates, governance): *narrative- and relationship-driven development, not skill-based development*
- Append-only prompt-version ledger: diffs between versions become the agents' curriculum; cross-model snapshots tracked in lmos_public_ver (in setup)

LMOS Data-Flow Layer | *concept stage* Planned

- Vision: a middle layer and plain-language dashboard for data handoffs across siloed departments at large companies

Education

CodePath | *WEB 102: Intermediate Web Development; CYB 102: Cybersecurity* Fall 2026 (in progress)
Arizona State University | *Master's in Business Management* Spring 2022
Western Governors University | *Bachelor's in Computer Science* Fall 2019
